

FIELD TRIAGE

Project Kumquat · Runtime Debugging

Stabilize → Document → Hand off.

الفرز الميداني

Swipe through the loop. Big text = read it standing over the animal.

READ FIRST

This deck **does not** replace a veterinarian.

It buys **time** and produces **data**.

Every path ends the same way:

→ **Hand off to a professional vet.**

التحويل للطبيب البيطري

THE LOOP

Run **in order**. Each step gates the next.

A → B → T → C → F

-  **A** — Airway · مجرى الهواء
-  **B** — Breathing · التنفس
-  **T** — Temperature · الحرارة
-  **C** — Circulation / CRT · التروية
-  **F** — Fluid status · السوائل

Do not jump ahead.

SPEC SHEET — Normal (Cat)

Know the baseline before you call a fault.

Read	Normal
 Temp	38.1–39.2 °C
 Heart rate	140–220 / min
 Breaths	20–30 / min
 CRT	under 2 sec
 Gums	pink + moist

Kittens chill fast. A cold kitten is already out of spec.

STEP A — AIRWAY

مجري الهواء

Is the airway **clear**?

- Look in the mouth — fluid, debris, tongue position
- Clear **visible** obstruction only — gently
- Re-check after clearing

 **CLEAR** → go to **B**

 **BLOCKED** → clear it, then re-check

● STEP B — BREATHING

التنفس

Present **and** effective?

- Watch the chest rise — count 15 sec x4
- Effort, noise, or **blue gums** = trouble
- Open airway · keep neck straight · escalate

✓ **BREATHING** → go to T

! **NOT EFFECTIVE** → support + **escalate NOW**

● STEP T — TEMPERATURE

الحرارة

In range (38.1–39.2 °C)?

- **Too LOW** (common in collapse):
 - Warm **gradually** — towels, body heat
 -  No sudden / aggressive heat
 -  Do **not** feed a cold, shut-down animal
- **Too HIGH:** cool gently, shade, airflow

 **IN RANGE** → go to **C**

● STEP C — CRT + GUMS

زمن امتلاء الشعيرات الدموية

Press gum → release → **count seconds**

- **Pink + under 2 sec** = perfusion OK
- **Over 2 sec / pale** = poor perfusion → shock path

The gum is your **status LED**.

✓ **under 2 s + PINK** → go to **F**

⚠ **over 2 s / PALE** → treat for shock

GUM COLOR DECODER

-  **Pink** — nominal
-  **Pale / white** — shock · anemia · poor perfusion
-  **Blue** — oxygen failure → **escalate now**
-  **Brick red** — hyperdynamic **sepsis**
-  **Yellow** — liver / red-cell breakdown

| Color + CRT together tell you which system is failing.

● STEP F — FLUID / SHOCK

الصدمة · السوائل

Stable, or collapsing?

- Collapse signs: weak pulse, cold limbs, pale gums, sunken eyes
- **Keep warm**, minimize handling
- Prevent further loss · prepare transport
- IV fluids are a **vet** intervention — get there fast

⚠ **COLLAPSE** → stabilize + **transport immediately**

FLUID DEFICIT (for the vet)

Hand them a **number**, not a guess.

$$\text{deficit (mL)} = \text{BW(kg)} \times \text{D(\%)} \times 10$$

- **BW** = body weight in kg
- **D** = estimated dehydration %

Shock index = HR ÷ SAP — rising = worse

Write it on the handoff note. Let the vet dose the fluids.

HANDOFF REPORT

Read this out to the receiving vet:

-  **Time** found + time on scene
-  **Baselines:** Temp · HR · RR · CRT · gum color
-  **Deviations** from normal
-  **Interventions:** warming, airway, position
-  **Computed deficit** (if estimated)
-  **History:** age, environment, exposure

Stabilize · Document · Hand off.

ESCALATE-NOW FLAGS

Do not finish the loop — **move** if you see:

-  **Blue** gums / not breathing
-  **No pulse** / unresponsive
-  **CRT over 3 sec** + pale
-  Active heavy bleeding
-  Severe cold + collapse

When in doubt: warm, protect the airway, transport.

 **We don't guess. We debug.**

Project Kumquat · in memory of **Koki**

طاعون القطط الفيروسي

Educational field aid — not a veterinary license.

Always hand off to a professional veterinarian.
